

Vacuum filters with hook opening - FB series

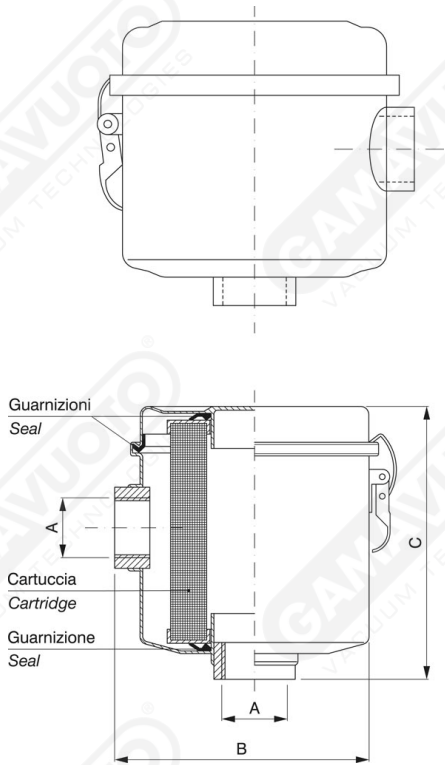

These filters are suitable for every kind of vacuum pump, thanks to the wide range of sizes and connections. The filters are produced in painted sheet steel, with gaskets on the cover to allow for a perfect seal; closure by release clamp for quick inspection. The internal cartridge, housed in a perforated metal case, is made of special treated paper with degree of porosity 5 +/- 7 micron.

Mounting

We suggest mounting these filters in a vertical position, with the tub facing downwards, thus ensuring easier maintenance. We advise against using these filters whenever water or oil vapours are present.

Maintenance

Periodically check the condition of the cartridge. For cleaning operations, open the cover, remove the cartridge, clean the inside of the filter and then change the cartridge.
